GLIS3 Analysis for Neonatal Diabetes Mellitus with Congenital Hypothyroidism

Clinical Features
Neonatal Diabetes Mellitus with Congenital Hypothyroidism [OMIM# 610199] is characterized by neonatal diabetes mellitus, severe congenital hypothyroidism, hepatic fibrosis, polycystic kidneys and congenital glaucoma (1). Facial dysmorphism, intrauterine growth restriction and mild intellectual disability have also been reported (2).

Molecular Genetics
Mutations in the GLIS3 [OMIM#610192] gene cause Neonatal Diabetes Mellitus with Congenital Hypothyroidism. To date frameshift mutations and gross deletions have been described (2). GLIS3 belongs to the GLIS subfamily of Kruppel-like zinc finger proteins and functions as an activator and repressor of transcription.

Inheritance
GLIS3 mutations follow an autosomal recessive inheritance pattern and are a rare cause of permanent neonatal diabetes mellitus. Parents of an affected child are most likely obligate carriers. Recurrence risk for carrier parents is 25%.

Test methods:
Comprehensive sequence coverage of the coding regions and splice junctions of the GLIS3 gene is performed. Targets of interests are captured and amplified using Agilent SureSelect target enrichment system. The constructed genomic DNA library is sequenced using Illumina technology and reads are aligned to the reference sequence. Variants are identified and evaluated using a custom collection of bioinformatic tools and comprehensively interpreted by our team of directors and genetic counselors. All novel and/or potentially pathogenic variants are confirmed by Sanger sequencing. The technical sensitivity of this test is estimated to be >99% for single nucleotide changes and insertions and deletions of less than 20bp. Deletion/duplication analysis of the GLIS3 gene is performed by oligonucleotide array-CGH. Partial exonic copy number changes and rearrangements of less than 400 bp may not be detected by array-CGH. Array-CGH will not detect low-level mosaicism, balanced translocations, inversions, or point mutations that may be responsible for the clinical phenotype. The sensitivity of this assay may be reduced when DNA is extracted by an outside laboratory.

GLIS3 sequencing
Sample specifications: 3 to 10 cc of blood in a purple top (EDTA) tube
Cost: $1000
CPT codes: 81405
Turn-around time: 4 weeks

GLIS3 deletion/duplication analysis
Sample specifications: 3 to 10 cc of blood in a purple top (EDTA) tube
Cost: $1000
CPT codes: 81404
Turn-around time: 4 weeks

Results:
Results, along with an interpretive report, will be faxed to the referring physician. Additional reports will be provided as requested. All abnormal results will be reported by telephone.
