Clinical Features
Pancreatic Agenesis [OMIM#260370] is characterized by early onset insulin-dependent diabetes and pancreatic exocrine insufficiency.

Molecular Genetics
Homozygous mutations in the PDX1 [OMIM#600733] gene leads to neonatal diabetes, which has been attributed to pancreatic agenesis, while heterozygous mutations in PDX1 result in a MODY4 [OMIM#606392] phenotype (1, 2). As MODY may be largely asymptomatic disease in younger years, hyperglycemia in obligate carriers may exist for years to decades before a diagnosis is made.

Inheritance
Pancreatic agenesis is a rare disorder. PDX1 mutations follow an autosomal recessive inheritance pattern. Parents of an affected child are most likely obligate carriers. Recurrence risk for carrier parents is 25%.

Test methods:
Comprehensive sequence coverage of the PDX1 gene is performed. Targets of interests are enriched and prepared for sequencing using the Agilent SureSelect system. Sequencing is performed using Illumina technology and reads are aligned to the reference sequence. Variants are identified and evaluated using a custom collection of bioinformatic tools and comprehensively interpreted by our team of directors and genetic counselors. All pathogenic and likely pathogenic variants are confirmed by Sanger sequencing. The technical sensitivity of this test is estimated to be >99% for single nucleotide changes and insertions and deletions of less than 20 bp. Deletion/duplication analysis of the PDX1 gene is performed by oligonucleotide array-CGH. Partial exonic copy number changes and rearrangements of less than 400 bp may not be detected by array-CGH. Array-CGH will not detect low-level mosaicism, balanced translocations, inversions, or point mutations that may be responsible for the clinical phenotype. The sensitivity of this assay may be reduced when DNA is extracted by an outside laboratory.

PDX1 sequencing
- Sample specifications: 3 to 10 cc of blood in a purple top (EDTA) tube
- Cost: $1000
- CPT codes: 81404
- Turn-around time: 4 weeks

PDX1 deletion/duplication analysis
- Sample specifications: 3 to 10 cc of blood in a purple top (EDTA) tube
- Cost: $1000
- CPT codes: 81403
- Turn-around time: 4 weeks

Results:
Results, along with an interpretive report, will be faxed to the referring physician. Additional reports will be provided as requested. All abnormal results will be reported by telephone.
